

Recent South Dakota Coyote Test Proves Successful

Losing calves, sheep, goats and poultry to night predators will end without harming them and you will be using the sun for power.

Nite Guard Solar®, a solar-powered flash of red light that turns on automatically at dusk and off at full daylight, is proven to do this. This unique product is currently being used by farmers and ranchers to protect their livestock. A recent coyote deterrent test stopped coyote kills on sheep ranches in South Dakota.

Animal behavior studies have shown that night predators all share a deep fear of flashing lights as they sense them to be another organism, such as man or another animal, and feel threatened. Raccoons, opossum, fox, skunks, bears, cougars and coyotes will leave your area alone – owls and hawks also are repelled by the Nite Guard Solar as well.

Nite Guard Solar is environmentally friendly, using only the sun or daylight to power them. This product has a range of ½ mile or more, is weather protected, small and compact (3"x3"x2") will operate to 30 degrees below zero and is protected against rain, snow and ice.

No more electric fencing, no more need

for guard dogs or the nasty time consuming job of trapping critters that are killing the livestock you worked so hard to raise. A typical arrangement of four lights will cover many acres as the lights are visible from ½ mile away or more to a predator.

Nite Guard Solar is not a strobe type light and will not be annoying to you, your neighbors or your own livestock. Nite Guard Solar is the original product backed by extensive customer service with 40 years of experience. "We are the premium predator

control headquarters. When you purchase our product you are also purchasing peace of mind that we will stand behind you offering information, guidance and support to eliminate your predator problem," says Jim Meyer, inventor of the Nite Guard Solar®.

Kill Underground Pests With Gas-Powered Rodent Control Machine

Clear out ground squirrels, gophers, prairie dogs and all other burrowing rodents with the gas powered Cheetah. This small engine does double duty, cooling and directing exhaust gases into an air-mixer valve that precisely meters the proper amount of carbon monoxide and air, driving the gases into rodent tunnel systems.

"When we moved to Central California four years ago, our property was covered in ground squirrels", explains Shaw. "I tried trapping, poisoning and pretty much everything else. Eventually, I even tried hooking a hose to my truck's exhaust".

Shaw realized the exhaust carbon monoxide (CO) needed to be under more pressure and volume (parts per million, ppm) to be effective.

The Cheetah motor and air-mixer valve produce 9500 ppm of CO in a 45 ft. tunnel in 30 seconds. The Cheetah consists of a small 2-cyl. engine. The 14-lb. Cheetah comes with a 1-gal. gas container, oil additive for 3-gal. of fuel, a flexible exhaust tube and a tool for spark plug removal. The engine is quiet and EPA approved to meet all standard emissions rules.

Shaw recommends running the engine for only 5 min. to treat up to 400 sq. ft. of burrows. For open burrow animals like ground squirrels, prairie dogs and groundhogs, the flexible exhaust tube is extended 6 in. or more into a tunnel and covered with a few inches of soil. Once the engine is running at ¾ throttle, other entrances within an 8 ft. area are filled in. If air can be felt coming out of the entrance, it's connected to the tunnel being fumigated. Larger areas may require treating multiple tunnel openings.

Shaw says the Cheetah is easy to use, lightweight and portable. It has deep burrow penetration, and is a cost effective system for dramatically reducing rodent populations.

"The Cheetah is safe to use with no explosives, poisons or chemicals. It's not harmful to root systems, has a long service life and is built tough to handle rigorous use. Our machine is environmentally friendly and safe for non-targeted animals", explains Shaw.

Shaw sells his machine direct. "I like to talk to the customer first to be sure the application will be effective for their particular problem," he explains.

Gas-powered Cheetah uses a small engine and fan to push exhaust fumes into pest tunnels.

The Cheetah is priced at \$989 and comes with a one-year warranty. Shaw's field testing produced an over 80% kill rate with the first application. Subsequent applications have proven to reduce rodent populations by more than 95%.
