

Art's Way Moldboard Plows Give You Control Over Soil Conditions And Field Residue

Adjust cutting width to match your soil, tilth, and tractor

Art's Way 7501 Plow offers more flexibility. Your soil conservation plans may require more surface residue than a traditional plow leaves, yet still demands the action that only a moldboard plow gives. The adjustable width-of-cut available on Art's Way semi-mounted plows is the cutting width to best utilize your tractor and plow. Choose from either hydraulic or manual controls. Plus, you can narrow the cut to leave more residue exposed or, conversely, widen the cut to completely bury residue. Infinite cutting width ranges from 14 to 22 in. on 5, 6, and 7/6 furrow row units. This gives you control over field residue to manage run-off, erosion, and compaction problems. Weed and Pest control can be maximized.

On-land or in-furrow, we'll keep you going both ways

Art's Way Two-Way Plows offer you a choice to match your preference. Both give you generous clearance for smooth residue flow and minimal compaction.

On-land or in-furrow options

Choose an on-land or in-furrow hitch to meet your plowing preference. In-furrow plows with 4, 5 or 6 furrows; with factory or field-installed extensions can expand the 4 and 6-furrow respectively. For maximum productivity, use on-land plows with larger tractors.

Available in 5-furrow (expandable to 6); 6-furrow (expandable to 7) and 7-furrow models.

Art's Way Offers Portable And Stationary Grinder/Mixers To Make Feed For All

Art's Way Portable Grinder/Mixers are available with either hammermill or rollermill action to grind feed into a consistent and uniform ration. Choose from the 105 bushel or the large 165 bushel tank to grind and mix up to 4 ton of feed rations including blending of micro ingredients. Up to 50% faster unloading with a 10-in. diameter unload system drastically reduces time and labor costs.

Stationary hammermills and rollermills provide feeding operations with efficient milling for top quality feed from your corn and small grains. While hammermills provide robust grinding operations for an even grind of feed, the rollermills roll feed, minimizing dust while providing palatable and digestible feed for improved feed conversion.
